

Build Date: 2012-02-23; Version: 2.4.2

===== New Features/Changes =====

- The Advanced Settings of an Advanced Print report has a new option to control whether the Last Line settings only apply to the last row on a page that is breaking or if it also applies to the last row in the entire report. Old reports will default to this setting being off.
- In the movement window that shows the potential movements after a chuteside job is done, the From Pen and To Pen columns now show the current count in the pens (before the move) so you can get an idea of how the move will affect the counts. Also, once you try to move the animals Fusion checks to see if the combined movements for any pen/lot will exceed the actual count currently in the pen and warns you giving you a choice of whether to proceed or fix the issue.
- You should now be able to use the ESC key to cancel most windows.
- In the Lot edit window, under the Projections tab, there are two new fields: Projected Out Date and Projected Out Weight. If you are submitting lot info to an outside source these are the fields that will now be sent to them as the "ProjectedOutDate" and "ProjectedAvgOutWeight" items. Upon upgrading, Fusion will automatically fill in these fields with the information that was already being sent. From then on you will have full control over this information. These fields also show up in the Lot Center window, both in the list area and in the detail area.
- In Withdrawal window there is now a user right associated with whether the Include Feed Withdrawals checkbox can be turned off. Also, when it is turned off, the Overall Withdrawal column label changes to "Drug Withdrawal" to emphasize that only drugs withdrawals are taken into account. Finally, if a report is printed, a note at the top of the report will indicate whether feed withdrawals were included in the report.
- A new user right exists that controls whether someone can set global defaults for list window views, searches, sorts, etc.
- Added a new field to the Animal list window called Carcass Dollars Per lb for comparing carcasses on a per unit basis.
- The Secondary Backup settings on Fusion Server now have the option to specify how many backups to keep for each secondary backup location.

===== Bug Fixes =====

- If two cohorts were created in a row on the same day, and both were for the same pen and lot, the Pen count would not update until that night. The same thing would happen if an in cohort was created for a pen and then a move occurred from the same pen right after. This is fixed.

- If an new Advanced Print report was created, but then canceled, a report with no name would still be created. This is fixed and any reports with no names have been removed.
- During a chuteside job with a Relocate By Sort subjob, Fusion would make the new pen the animal's current pen, but not the animal's home pen. This is fixed.
- In the Out Cohort edit window, when tabbing out of the Out Time field the cursor would go into the Entity field. This was fine, but even when no information changed, Fusion would ask about changing the pay weight which was annoying. This is fixed and you will not be asked about changing the weight unless the weight might actually be different.
- If you edited the Previous RFID field in the Animal History window, the change did not save. This is fixed.
