

Build Date: 2012-07-31; Version: 2.5.1

===== New Features/Changes =====

- You can now link from the Animal list window to the In Cohort list window.

===== Bug Fixes =====

- In the Job Batches list window, several different computers could be listed with the same name: "\*". A change has been made so that if the underlying MAC address cannot be determined by Fusion, it will automatically create one which fixes this issue.
- Double-clicking an animal or chuteside job in an Entity Chooser window resulted in an error. This is fixed.
- If a feed withdrawal for an animal was based on a certain ingredient being part of a load, and if the load was manually edited so that ingredient was set to zero pounds, Fusion still included the ingredient as part of the withdrawal. This is fixed.
- Using the magnifying glass to find a contact to add to a contact related field quit working. This is fixed.
