

Fusion Release Notes

Version: 2.9; Build Date: 2014-09-15

New Features

- Fusion is now fully documented. All documentation is available on our website and from within Fusion. Nearly all windows have a help button which will take you directly to the relevant documentation for the window.
- The Bulk Lock Inventory window can now show the current balances so you can lock them directly without entering each number.
- You can now reset the size and position and type of the Scale Indicator window by clicking the info button directly on the window.

Changes

- BIXS related functionality has been removed due to unresolvable changes made to BIXS servers.

Bug Fixes

- Brand new installs showed a "Mandatory Field is Null" error when starting up. This is fixed.
- When looking up animals via RFID automatically during a job, Fusion was also looking at the non-current animals. This is fixed.
- Fusion doesn't allow using the Record Weight button in the Mix Load window if a micro ingredient is selected. This should alleviate accidental weight recording for micros. Also, Fusion won't auto select a micro after hitting Record Weight either.
- Inventory levels for micro ingredients were not tracked accurately enough. You can now tell Fusion that certain ingredients should be tracked with a higher precision for inventory purposes. To do this, use the new "Track with extra precision" option in the Commodity Edit window. If you have been using micro ingredients in Fusion in the past few months, you should turn this option on for each micro ingredient after upgrading and then have Fusion recalculate the inventory for micro ingredients for the past few months using the Inventory Queue window.
- When first transitioning, it was possible for some bunk calls to be missed. This is fixed.
